Specifically, the indicated order and orientation of each sequence contrig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassembles, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

Sequencing vector; plasmid; in/a; 100% of reads Sequencing vector: plasmid; in/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319

                                  **NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. Gaps between the contigs are presented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

**This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

Sciences of Matter; 1-3-1 Kagamiyama, Higashi-Hiroshima, Hiroshima 739-8930, Japan (E-mail:kinashi@hiroshima-u.ac.jp, Tel:81-824-24-7869, Fax:81-824-24-7869, Fax:81-824-24-7869, Fax:81-824-24-7869, Fax:81-824-24-7869, Using restriction fragments and nested deletion fragments of the ordered cosmid library of pSLA2-L.

130 ORFs. Gene prediction was based on the unique codon usage in Streptomyces Gene prediction was based on the unique codon usage in Streptomyces (Bibb et al., Gene 30:157-66 (1984)) using the FramePlot program of Ishikawa and Hotta (FEMS Microbiol Lett 174: 251-253 (1999)) as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       http://www.nih.go.jp/-jun/cgi-bin/frameplot.pl. Where possible we chose an initiation codon (atg. gtg. ctg or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13 bp before the initiation codon). If this could not be identified we chose the most upstream initiation codon.

Three-fourths of the pSLA2-L DNA are occupied by biosynthetic genes Three-fourths of the pSLA2-L DNA are occupied by biosynthetic genes (three PKS gene clusters for lankacidin, lankamycin and an unknown type II polyketide, a carotenoid biosynthetic gene cluster, many regulatory genes and others). The range of each biosynthetic gene clusters in most cases and may be revised in future.

The RPCI-I human BAC library was made from the blood of one male donor, as described by Osogawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bopgac.med.buffalo.edu)
NECTOR: pBACE3.6
NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RPII-347L11. Actual start of base position 217346 of RPII-438012; actual end is at base position 10f RPII-438012; actual end is at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NOTICE: This sequence may not represent the entire insert of this fone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Direct Submission
Submitted (09-JAN-2002) Department of Genetics, Washington
University, 4444 Forest Park Avenue, St. Louis, Missouri 63108,
On Sep 26, 2011 this sequence version replaced gi:15144350.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Data from AC079879 was used to finish this clone, AC012363. Polymorphisms exist between AC012263 and AC079879. There is single plasmid region from 188387 to 188395.

This sequence has been validated by Multiple Complete Digest fingerprinting. Comparison of the experimentally derived digest fingerprinting. Comparison of the experimentally derived digest fragments with sequence-predicted fragments is given below.

The electronically-digested sequence consists of both insert and vector, in order to accurately represent the entire circular BAC. Small fragments below a variable cutoff (approximately 400-800 bp) are not resolved in the fingerprint and hence do not appear in the table. There are no significant remaining discrepancies between the experimental and predicted values. Uniquely ordered fragments are separated by dashed lines.

                                                                                                                                                                                                                                                                                                                                                        Sequence Quality Assessment:
This entry has been annotated with sequence quality
estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero.
Quality levels above 40 are expected to have less than
1 error in 10,000 bp.
Base-by-base quality values are not generally visible from the
Genbank flat file format but are available as part
of this entry's ASN.1 file.

On Nov 15, 2002 this sequence version replaced gi:23908040.

The Sequence in this seasembly is a combination of BAC based reads and whole genome shotgun sequence version replaces as caffeld in the Atlas (http://www.hgsc.bcm.tmc.ed/projects/tat/). Each contig described assembly (a 'contig-scaffold'). Within each contig-scaffold, Within each contig-scaffold, With Na to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)
NOTE: This sequence may represent more than one clone.
NOTE: This is a "working draft, sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           93046: contig of 93046 bp in length 9146; gap of unknown length 104391: contig of 11245 bp in length 104491: gap of unknown length 109137: contig of 4646 bp in length 109237: gap of unknown length 116031: contig of 6794 bp in length 116131: gap of unknown length 116131: gap of unknown length 136149: contig of 20018 bp in length 136149: gap of unknown length

Sat Genome Sequencing Consortium.

Sibmitted (12-COCT-2002) Human Genome Sequencing Center, Department of Molecular and Human Genome Sequencing Consortium.

List of Molecular and Human Genome Sequencing Center, Department of Molecular and Human Genome version replaced gi:21003188.

On Oct 12, 2002 this sequence version replaced gi:21003188.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig Gescribed in the feature table below represents a caffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold') within each contig-scaffold by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. * NOTE: Estimated insert size may differ from sequence length

(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)

* NOTE: This sequence may represent more than one clone.

* NOTE: This sa a 'working draft' sequence. It currently

* consists of 35 contigs. The true order of the pieces

* sa not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

The invention relates to an isolated polymucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (Aazuli19-Aazi2066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polymucleotides are useful coding protein or complementary sequences. The polymucleotides are useful coding protein or complementary sequences. The polymucleotides are useful coding protein or complements or for physical mapping of human genome. The encoded polympediaes (ABPG8902-ABPG8949) are useful as molecular coded polympediaes (ABPG8902-ABPG8949) are useful as molecular compliferative disposition and diagnostic assays and for treating collipsion of a nuclear configuration of a nuclear configuration of a nuclear configuration of a nuclear configuration disposition of allocates are nuclearly fungal, or located at for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO configuration int/pub/published_pot_sequences. Claim 1; SEQ ID NO 126; 1012pp + Sequence Listing; English.

**.** Novel human disease detection and treatment polypeptide, useful in diagnosis, prevention or treatment of cell proliferative disorders earteriosclerosis, cirrhosis and an autoimmune/inflammatory disorder e.g. AIDS

Claim 1; Page 375-376; 618pp; English.

The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (I) selected from a polypeptide having a sequence selected from 254 sequences (ABPS1231-ABPS1484) given in the sequence selected from 254 sequences (ABPS1231-ABPS1484) given in the specification, a naturally occurring polypeptide comprising a sequence having at least 90% identity to (I) or a biologically active or immunogenic fragment of (I). (I) is useful for screening a compound for effectiveness as an agonist or antagonist, for screening a compound that specifically binds (I) or moncolonal antibody by hybridoma technology. Nucleic acids (II) (ABQ72449-ABQ72700) encoding (I), and for preparing a polyclonal or moncolonal antibody by hybridoma technology. Nucleic acids (II) (ABQ72449-ABQ72700) encoding (I) are useful for screening a compound for effectiveness in altering expression of a target polynucleotide comprising. Oligomuclectides and antibodies are useful for detecting MDDT in a sample or for assessing toxicity of a test compound, in a sample or for assessing toxicity of in a sample, and for purifying (I) from a sample. A composition comprising (I) in a sample, and for purifying (I) from a sample. A composition comprising (I) in a sample, and for purifying (I) from a sample. A composition of functional MDDT.

This invention relates to twelve human receptors CDNA sequences

referred to as REPTR-1 to REPTR-12), and the proteins encoded thereby.
The proteins of the invention may have antifinflammatory, cytostatic,
immunosuppressive, antiviral, anti-HIV, antiarthritic, muscular active
general, anticonvulsant, nootropic, neuroprotective, antiallergic
activities. The sequences of the invention may be used to produce REPTR
activities. The sequences of the invention sequences may be used to raise
anti-REPTR antibodies. These molecules and the REPTR polynocleotides and
prevention of gastrointestinal (e.g. gastritis, oesophageal carcinoma,
Crohn's disease, irritable bowel syndrome, ulcerative colitis,
endocrine (e.g. hypothalamus disorder, Kallman's disease), autoimmune/
inflammatory (e.g. acquired immune deficiency syndrome (AIDS),
rheumatoid arthritis, allergies, osteoarthritis, diabetes mellitus,
multiple sclerosis, systemic lupus erythematosus), cell proliferative
dystrophy), neurological (e.g. buchenne and Becker muscular
dystrophy), neurological (e.g. plitepy, Alzheimer's disease,
Huntington's disease) and reproductive (e.g. infertility, endometriosis)
claisorders. Numerous other examples of each disorder are given in the
specification. The present sequence represents the human REPTRB CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Twelve human receptors (referred to as REPTR-1 to REPTR-12), useful in the diagnosis, treatment and prevention of gastrointestinal (e.g. gastritis), autoimmune/inflammatory (e.g. osteoarthritis) and cell proliferative (e.g. cancer)disorders

```

The present invention describes a Babesia canis associated protein (I), comprising a Bevir15 protein of 15 kD molecular weight (MW) and having a sequence of at least 80% homology to a sequence (ABP53714) of 141 amino acids, or a Bevir32 protein of 32 kD WW and having a sequence of at least 80% homology to a sequence (ABP53715) of 285 amino acids, or their immunogents fragments. (I) have antiparasitic and immunostimulant activities, and can be used in vaccines. (I) can also be used for the preparation of a vaccine for combating B. canis infections. (I) is also useful in a diagnostic test for the detection of antibodies against B. Canis associated antigenic material. The present sequence represents a PCR primer for Babesia canis Bovir which is used in an example from Example 2; Page 12; 41pp; English.

ğ 3 ç, Katz Χ, Puranam Portbury SD, Barney S, Thomas MB,

WPI; 2002-017408/02. P-PSDB; AAU69691 Novel nucleic acids referred as protective sequences and their encoded products for diagnosing, treating diseases involving cell death, including neurological disorders e.g. stroke and for identifying modulators.

Claim 2; Figure 10A; 256pp; English.

The invention relates to isolated protective sequence polypeptides (I) and polynucleotides (II). (II) is useful for transferring a protective and polynucleotides (II). (II) is useful for transferring a protective conditions of sequences into a call, which delays and/or prevents the call from undergoing cell death. Protective sequences, their products or at stages for treatment and diagnostic of conditions, disorders or diseases involving cell death. The protective sequences and their products are useful for preventing or treating disorders of the central cerebral obedema, infections such as menting disorders of the central nervous system including neurological and psychiatric conditions, cerebral obedema, infections such as menting disorders of the cerebral obedema, infections such as menting disorders of the cerebral obedema, infections such as menting disorders of the cerebral obedema, infections such as menting disorders of the control of system including diabetic neuropathy, disorders which cause cell death in organ systems including blood vessels, heart (ischaemia), blood cells (autoimmune hamolytic anaemia), respiratory system (asthma), cral cavity gastrointestinal tract, liver (cirrhosis), pancreatitis, polycystic renal disease, urinary tract, liver (cirrhosis), pancreatitis, polycystic renal disease, urinary tract, genitalia of (congenital anomalies), endometriosis, breast (chronic mastitis), thyroid (congenital anomalies), and one promosticins promote cell death and are useful for treating and/or amaliorating cancer and autoimmune diseases. The compositions promote cell death and are useful to crase an immune response, as a reagent in assays designed to raise an immune response, as a reagent in assays designed to raise an immune response, as a reagent in assays designed to raise an immune levels of the protein is expressed and to isolate receptors or ligander Accresponding protein is expressed and to isolate receptors or ligander preservable in the invention.

Compositions and methods for the detection of hemaiological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma -Claim 31; Pages 504-505; 1252pp; English

The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence is the coding sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen (s) a sample obtained from the partient (an increased level of the polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular, lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B cell non-Hodgkin's lymphoma.

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity

Claim 1; SEQ ID No 237; 114pp; English.

The invention relates to detecting (MI) granulocyte (GC) activation (CCA), by detecting the level of expression of gene (s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level in an unactivated (CC GC, where differential expression of GS is indicative of GGA.

The included are modulating (M2) GA by contacting GC with an agent capable of modulating GA or an inflammation (especially contact or a pathogen or sterile inflammation) (especially contact or a pathogen or sterile inflammation (especially contact) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the contact of expression profile; (3) detecting (M4) an inflammation (especially contact) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation with an agent that modulates the expression of gene (s) from GS, where the level of expression in a subject, exposure of a subject to a pathogen or sterile inflammation with an agent that modulates the expression of gene (s) from GS, manulating GA, M3 is useful for screening an agent that modulates the expression of gene (c) for partial and subject, exposure of a subject to a pathogen or response in a subject, exposure of a subject to a pathogen or response in a subject, exposure of a subject to a pathogen or creptoring an inflammation in a result of the subject to a pathogen or response in a subject, exposure of a subject to a pathogen or response in a subject, exposure of a subject to a pathogen or response in a subject, exposure of a subject to a pathogen or response in a subject, exposure of a subject to a pathogen or response in a subject, exposure of a subject to a pathogen or

The invention relates to isolated protective sequence polypeptides (I) and polymucleotides (II). (II) is useful for transferring a protective and polymucleotides (II). (II) is useful for transferring a protective sequence into a cell, which delays and/or prevents the cell from undergoing cell death. Protective sequences, their products or antibodies are useful diagnostically, prophylactically, therapeutically cor as targets for treatment and diagnosts of conditions, disorders or diseases involving cell death. The protective sequences and their products are useful for preventing or treating disorders of the central cerebral oedema, inflections such as mentalities, degenerative diseases such as Alzheimer's and motor neuron disease, demyelinating diseases such as militable solenosis, nutritional conditions, disorders of the such as Alzheimer's and motor neuron disease, demyelinating diseases such as multiple solenosis, nutritional conditions, disorders of the peripheral nervous system including diabetic neuropathy, disorders which cause cell death in organ systems including blood vessels, heart (ischaemia), blood cells (autoimmune hemolytic anaemia), respiratory system (asthma), oral cavity, gastrointestinal tract, liver (cirrhosis), plond carelies), endometriosis, breast (chronic mastitis), thyroid (congenital anomalies), endometriosis, breast (chronic mastitis), thyroid (steeporosis) if he compositions promete cell death and are useful for treating physiological impacts on compounds are further useful for treating physiological impacts on congens caused by infection which induce cell death, and are useful to raise an immune response, as a reagent in assays designed to capanitatively determine lavels of the protein in biological lingated and expensed and expenses as described in the invention.

Compounds are further useful for creating physiological inserves the compositions or ligands as described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8 ThrAsnPheValAlaGluAsnArgProThrPheGlyGluThrPheAspValMetArg---

                                                                                                                                            This sequence encodes a glutathione S transferase/human p57 fusion protein. This sequence is derived from the plasmid pGEX/hp57. This plasmid is used in the expression of the human p57 protein. p57 contains a leucine rich C-terminal peptide which comprises a leucine residue after each 7 amino acids and a WD40 repeated structure region containing flux WD40 regions. p57 forms a dimer. It can be used in the development of an anti-cancer agent and an anti-HIV agent. It can also combine with actin in the control of cell movement.
                                                                                                                       75 LysproproArgProGlnSerThrLysSerProGluLeuArgGluLeuSerArgLysIle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             human p57
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence encodes a glutathione S transferase/truncated human pfusion protein. This sequence is derived from a derivative of the plasmid pGSX/hp57. This plasmid is used in the expression of the human p57 protein. p57 contains a leucine rich C-terminal peptide which comprises a leucine residue after each 7 amino acids and a WD40 repeated structure region containing five WD40 regions. p57 forms a dimer. It can be used in the development of an anti-cancer agent and an anti-HIV agent. It can also combine with actin in the control of cell movement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A new protein, p57, comprising WD40 repeat region - used for development of anti-cancer and anti-HIV agents
                                                                                                                                                                                                                                                                                                                                        WD40 repeated structure region; bovine p57 protein; dimer; anti-cancer; anti-HIV agent; actin; cell movement; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers
                                                                                                                                                                                                                                      854 CCTCCCCCG------CTGGCCTCACAGATC

and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the deepere of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the repeated of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ARBO3410-ARBO3412 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ProGlyThrGlyAlaSerAlaIleAlaAlaThrValThrProLysGlyAlaSerMetLys

(EPIG-) EPIGENOMICS

Determining the degree of cytosine methylation in genomic DNA, for diagnosis and prognosis, comprises selective hybridization amplicons from chemically treated DNA. ä Guetig Berlin K, Piepenbrock C, 2002-371829/40 olek A, 

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a general sample of DNA. The sample is treated chemically to convert or denomically that contains the target C is amplified to form a labeled amplicon. DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligoners and the degree of hybridisation to both classes is determined from the label on the amplicon. The degree of methylation is calculated. The method classes of oligoners, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiations or single nucleotide polymorphisms status of many C residues to be determinated simulationably. ABG13410-ABG54121 represent genomic DNA sequences used to illustrate the body of the chermining the degree of Cytosine methylation described in the degree of Cytosine methylation described in

Novel polynucleotide comprising Bifidobacterium genome sequence useful as a probe or primer for detecting and/or identifying Bifidobacterium longum in a biological sample

Claim 1; SEQ ID 1; 80pp; English.

The present invention describes a polynuclectide (I) comprising a sequence of a Bifidobacterium genome selected from the nuclectide sequence given in ABO81842 and ABO81843, or a sequence exhibiting at least 90% identity or which hybridises with the sequence exhibiting at least 90% identity or which hybridises with the sequence exhibiting at least 90% identity or which hybridises with the sequence given in ABO81843. Also described is a polynuclectide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences given in ABD65258 to ABD66354 ligated in frame to a polynuclectide encoding a heterologous polypeptide. (I) has antidiarrheic and entibacterial activities, and can be used as an inhibitor of Salmonella. (I) (Which is a probe) is useful for the detection and/or identification of Bifidobacterium longum in a biological sample. A carrier containing the lactic acid bacteria and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from milk, yogurt, curd, cheese, fermented milks, milk based fermented products, loe-creams, fermented enries, milk based fermented products, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or chips to carry out analysis of the Bifidobacterium gene. Abg81844 to ABQ81850 represent Bifidobacterium related nucleotide sequences given in the Sequence or a backfiderium che present invention but not mentioned further within the sequence. cation. %XCCCCCCCCCCCCCCCCCCCCCCCCCX

adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTS provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF01478 to AAF11247 represents ESTS from Fusarium venenatum; AAF11248 to AAF11347 represents ESTS from Aspergillus niger; AAF11853 represents ESTS from Aspergillus oryzae; and AAF14879 to AAF14878 represents ESTS from Aspergillus oryzae; all specifically claimed in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           482

A comparison of AAN60287 with the CDNA of the HTLV-III genome revealed one particular clone, designated p7.11 which contained a DNA sequence encoding this peptide (AAP60308) sequence. This approx. 2.2 kilobase covers the precursor gag region and encodes, 5' to 3', p-12, p-15, p-24 a second p-15 protein, and approx. 300 extra base pairs 3' to the gag region (see AAN60288). Acquired immune deficiency syndrome polypeptide(s) - obtd. by molecular cloning etc. and used for diagnosis and in vaccines against virus disease Sequence 9213 BP; 3297 A; 1656 C; 2217 G; 2043 T; 0 other; WPI; 1986-177602/28. (a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer
in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate call carcinogenic potential of a compound;
(g) decermining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a patient; (I) is also useful as a pharmacodyanamic or pharmacogenomic marker. 88999999999998888

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the appecification or its complement. (I) is useful for (C) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient. Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer -(I) is also useful as a pharmacodyanamic or pharmacogenomic marker. The sequence represents a polynucleotide encoding a chimeric CauTaq DNA polymerase polypeptide. The chimeric polypeptide comprises a 3.-5, exonuclease domain from one DNA polymerase and a DNA polymerase domain from a heterologous DNA polymerase. This molecule has a domain exhibiting 3'-5' exonuclease activity derived from Cau DNA polymerase and another exhibiting DNA polymerase activity from Taq DNA polymerase. These chimeric sequences are useful in molecular biology and gene technology techniques, especially second strand DNA synthesis, PCR amplification and polymerase particularly useful in techniques where the fit between the primer and the template DNA is not exact. Chimeric DNA polymerase useful in molecular biology and gene technology techniques, has domain having proof-reading activity from a DNA polymerase domain from heterologous DNA polymerase -...1812 -*tag= a product= "Chimeric CauTaq DNA polymerase" /partial /note= "No stop codon present Claim 13; Page 44-48; 66pp; English. Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea -

Claim 7; Page 1676; 1760pp; English.

proteins from Neisseria genomic sequences. AAAB1453 to AAAB2414
represent specifically claimed Neisseria meningitidis genomic DNA
sequences; AAAB1260 to AAAB1303 and AAAB1550 to AAB2563 represent
Neisseria DNA sequences and their corresponding proteins; AAAB1254 to
AAAB1259 and AAAB1304 to AAAB1321 represent PCR primers used in the
isolation of Neisseria meningitidis DNA sequences; and AAAB1322 to
AAAB1452 represent Neisseria meningitidis MenB Dynuclectide ORF
sequences, which are all used in the exemplification of the present
invention. The mucleic acid sequences, protein sequences, and antibodies
against them, can be used in the manufacture of a composition on be used as a medicament (or in the manufacture of
medicament) for treating, preventing or diagnosing infection due to
Neisserial bacteria. For example, some of the identified proteins could
be components of vaccines against Meningococus B; against all serotypes;
and/or against all pathogenic Neissariae. Identification of sequences
from the bacterium will also facilitate production of biological probes,
particularly organism-specific probes. Attempts to make efficacious
whitinglococus B vaccines have failed mainly due to make efficacious
whitinglococus B. vaccines have failed mainly due to make efficacious
whitinglococus B vaccines have failed mainly due to make efficacious Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more variable regions. The present invention describes methods of obtaining immunogenic

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags of for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in cappostics, forensics, gene mapping, identification of mutations cappostics for genefic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human capposition, but was obtained in electronic format directly from WIPO to the inventor.

The polypeptide and for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO to the five the sequences.

Isolated polypeptide for treating, preventing and prognosing disorders related to the endocrine system including endocrine disorders, reproductive disorders, and gastrointestinal disorders and also for testing and detection e.g. diagnosis

Disclosure; SEQ ID No 577; 558pp; English

The invention relates to cDNAs encoding novel human endocrine antigens or a fragment having biological activity, a domain, an epitope, full length protein, variant, allelic variant or a species homologue of the cDNA/antigen. The DNAs and polypeptides are useful for preventing, treating or ameliorating a medical condition when administered e.g. by gene therapy or antisense-therapy). Identifying mutations in the genes coding for the antigens is useful for diagnosing a pathological condition or a susceptibility to a pathological condition. The DNAs, antigens and antibodies raised against the antigens useful for treating, preventing and/ or prognosing disorders related to the endocrine system or hormone imbalance or reproductive disorders, cancers of endocrine

WPI; 2001-343950/36. P-PSDB; AAU03538. Nucleic acids encoding human kinase polypeptides, useful for preventing

diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections 

Example 1; Figure 1; 433pp; English.

AASO6701-AASO6757 encode for novel human protein kinases #1-57. The

novel protein kinases have been identified as members of the tyrosine

or setne/throsine kinase (PTK and STX) families. The polymucleotides

or setne/throsine kinase polymeptides may be used in the

concoding protein kinases and the polymoptides may be used in the

prevention, diagnosis and treatment of diseases associated with

concoding proteine kinase expression. For example, they may be used to treat

cancers (especially cancers of haematopoietic origin), cardiovascular

cancers (especially cancers of haematopoietic origin), cardiovascular

cancers (especially cancers of haematopoietic origin), neurological

cimenum related diseases (e.g. theumatoid arthritis), neurological

discaders (e.g. achizophrenia), neurodegenerative disorders (e.g. dispases (e.g. HIV) and reproductive disorders (e.g. infertility).

Additionally, polymucleotides encoding protein kinases may be

used for gene therapy and as DNA probes in diagnostic assays.

The protein kinase polypeptides may be used as antigens in the production

of antibodies against the protein kinases and in assays to identify

modulators of protein kinase expression and activity.

New human kinase polypeptide, useful in diagnosis, prevention and treatment of cancer, immune disorder, growth and developmental disorder, cardiovascular disorder and lipid disorder

Claim 5; Page 187-188; 196pp; English.

The present invention relates to an isolated human kinase polypeptide (FRIN) or a biologically active/immunogenic fragment of PKIN. PKIN is useful for diagnosing, treating and preventing cancer (e.g., leukaemia, conseful for diagnosing, treating and preventing cancer (e.g., leukaemia, conseful for diagnosing, treating and preventing cancer (e.g., leukaemia, consense, allergy, anaemia, aschma, Crohn's disease, rheumatoid arthritis), a growth and developmental disorder (e.g., bursitis, cirrhosis, hepartis, parthritis, psoriasis, Cushing's syndrome, a cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial curscriptor), and a lipid disorder (e.g., fatty liver, cholestasis, cannesse, pkin is useful for creating knockin humanised animls or transgenic animals to model human diseases, in somatic or germline gene therapy, to compare a transcript image of a tissue or cell type, for detecting cateforming c

The method comprises contacting a biological sample from the patient with prostate cancer-associated polymucleotides (designated PC genes) that selectively pyridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polymucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer, as well as for identifying modulators of prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications. ABK92115-ABK92263 represent prostate cancer-associated polynucleotide --------SerThrLysSerProGluLeuArgGluLeuSerArgLys 2323 CCTCCTCCTACCCCTAGAGCCCTCAGAATGACTCACACTCTCCCTTCTTCCTAC 2376 ------ArgValAsnHisArgLeuProGluGlyHis 116 HIV-1; human immunodeficiency virus type 1; AIDS; attenuation; vaccine; DNA methylation; ss. 5607 ---AATGGACACTATTAGAGGAGCTTAAGAACGAAGCGGTTCGCCATTTTCGCG 5663 113 ProGluGlyHis-------ProbeuLeuGluLysArgAlaGluTyrPheArg 127 22 PheAspValMetArgGluAlaLeuLeuArgValLysSerSerGluArgLeuAlaMetLeu 41 A novel, attenuated HIV-1 genome, HIV-1 CpG1 (AAT14180), is hypersubstituted with noninformational or 'silent' CpG segments. Addition of the CpGs to the genome does not alter the amino acid sequence of the encoded proteins but makes the synthetic genome a target for host cell-methylases. Thus, although the virus for which this genome codes is capable of infecting a cell, the proviral genome is easily inactivated by methylation and kept permanently in a dormant state. The virus can be used for the prepn. of live virus vaccine or to raise diagnostic antibodies. 5373 TICGACTGTTTTCGGACTCGGCGATACGC----------MetCysGlyHisArgVal 5403 AAGGCGTTACTCGGACACATCGTTTCGCCGCGCTGCGAATATCAAGCGGGACATAACAAG 53 LeuProGlyThrGlyAlaSerAlalleAlaAlaThrValThrProLysGlyAlaSerMet 93 LysIleArgGluMetAsnLysThrIleSerGlnGluSerAlaArgValAsnHisArgLeu 73 LysLeuLysProProArgProGlnSerThrLysSerProGluLeuArgGluLeuSerArg 5559 -----TGGAACAAGCCCCAGAAGACCAAGGCCACAGAGGGAGCCACAATG Attenuated virus contg. additional methylation sites in its genome - used to induce protective immunity and to raise antibodies for diagnostic use. Claim 1; Page 47-49; Sipp; English.

The sequence represents the novel polymucleotide of the invention encoding a polypeptide having haloperoxidase activity, isolated from Phaeotrichoconis cotelariae. The haloperoxidase of the invention works as an enzyme or by oxidation of halide ions, having bactericial activity. The nucleotide sequence is useful for DNA shuffling (recombination) such that new polymucleotide sequences obtained may encode new polypeptides having haloperoxidase activity with improved properties. The invention relates to methods for killing or inhibiting the growth of microbial cells. The haloperoxidase of the invention may be added to become a component of a detergent composition. The compositions may also comprise one or more other enzymes such as a protease, a lipase,

The sequence represents the coding sequence for the novel polypeptide of the invention having haloperoxidase activity. The polypeptide of the invention also has antibacterial activity. The haloperoxidase is used to kill or inhibit growth of microbial cells. It may be used to preserve or disinfect, for example in water based paints or personal care products, for cleaning surfaces and cooking utensils in food processing plants and any area where food is prepared or served. It may also be used in enzymatic bleaching applications, for example pulp or stain bleaching.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      54 ProGlyThrGlyAlaSerAlaIleAlaAlaThrValThrProLysGlyAlaSerMetLys

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity

Claim 1, SEQ ID No 1201; 114pp; English.

The invention relates to detecting (M1) granulocyte (GC) activation (CCA), by desecting the level of expression of gene (s) (Gs) identified by DNA chips analysis as given in the specification, and comparing the axpression level in an unactivated comparing the expression level to an expression level in an unactivated (CC where differential expression of Gs is indicative of GCA.

Also included are modulating GA by contacting GC with an agent chapteled are modulating GAs by contacting GC with an agent chapteled of modulating GAs or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the chronic in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the choronic in a tissue, an allergic response in a subject con a subject to a pathogen or sterile inflammatory disease, by contacting the level of expression in a sample of the tissue of gene (s) from GS, where the level of expression of the gene is indicative of inflammation, and allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having inflammation with an asubject, exposure of a subject to a pathogen or sterile inflammatory disease, and is useful for screening an agent that modulates the expression of gene (s) contacting an inflammation in a tissue, having condulating GA, M3 is useful for screening an agent that modulating an inflammation in a subject to a pathogen or screille cresponse in a subject to a pathogen or terile of glomerulonephritis, asthma, thrombosis, cardiac reperfusion injury, ARDS, adult respiratory distress syndrome, confinementary disease, also bacterial infection, viral infection, procozol infection, fungal infection and M5 is perianted specification, but was obtained in electronic of the printed specification; but was obtained in electronic of the printed specification. ftp.wipo.int/pub/published_pct_sequences.

Diagnosing and detecting the progression of liver cancer, hepatcoellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in liver tissue sample

Claim 1; SEQ ID NO 3774; 298pp; English.

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumouur in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN91503-ABN97455 in a tissue sample. The method of the invention has hepatocropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug toxicity, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO or fifth. WIPO.INT/pub/published_pot_sequences.

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in Abiofo664 to Abbroalo), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical contracture and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, cosophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer. 476 oGluLeuArgGluLeuSerArgLysIleArgGluMetAsnLysThrIleSerGlnGluSe 105 65 31 ArgValLysSerSerGluArgLeuAlaMet-LeuArgAlaLeuAlaGlyMetCysGlyHi 50 sArgValLeu-------ProGlyThrGlyAlaSerAlaIleAlaAlaThrVa :|||||||::: 535 CCGAGTTGTCATCATACACGTGCGGCCCAGGCCTCCTCCTCGCGCAGCCATGTT 595 decadecreaderrecanderreceracedecencides and a decaderation of the contract 1ThrProLysGlyAlaSerMetLysLeuLysProProArgProGlnSerThrLysSerPr Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set Drosophila melanogaster genomic polynucleotide SEQ ID NO 31519. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in eludidating cell signalling and call-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABLi6175) and the encoded proteins

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to urzacil, then part of the genomic cytosine (C) but not methylated C, to urzacil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the reapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the charm of the determining the degree of cytosine methylation described in Human, cytosine methylation, 5'-CpG-3', uracil; cytosine, diagnosis, drug; side effect, cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; SNP; cell differentiation; ds. Determining the degree of cytosine methylation in genomic DNA, for diagnosis and prognosis, comprises selective hybridization amplicons from chemically treated DNA -Sequence 681 BP; 67 A; 83 C; 251 G; 280 T; 0 other; Claim 12; 56pp + Sequence Listing; 56pp; German. ä Guetig Berlin K, the disclosure of the invention 01-SEP-2001; 2001WO-EP10074. 01-SEP-2000; 2000DE-1043826. 05-SEP-2000; 2000DE-1044543.
